

HODL

What is HODL?

HODL is a Binance Smart Chain based protocol that rewards token holders a 3% fee that is charged on each transaction and instantly splits that fee among all holders of the token. While many other BSC tokens offer a “farming” or “pooling” option - based on the protocol of HODL, token holders simply have to own HODL in order to start collecting more tokens from the transactions of others.

Why BSC?

The Ethereum network is experiencing more and more transactions and in turn make ETH GAS prices skyrocket. The Binance Smart Chain doesn't jeopardize any transaction or swap speed all while keeping GAS fees low.

HODL

Why no farming?

While the idea of large APY from token and LP locking and farming are nice, we believe the HODL protocol offers a more hands off approach. The problem with farming ranges from impermanent loss, additional LP swaps and another layer of tracking overall. The redistribution mechanic of the token simply allows you to buy and forget, get on with your life and HODL!

Our aim with HODL was to tie the ease of use of buying a token with the upside of yield farming returns.

How long does the redistribution last?

Are you sitting down? Good.

Forever. Depending on the volume and transaction sizes, the amounts you will receive on a daily basis will surely differ - however they will be constant.

What is the circulation of tokens?

All tokens are in circulation. None are held for the team, or a development fund - 100% of the tokens were available when listed.

What is the total supply?

There are a total of 100 Million HODL tokens. There will never be any more minted or any more in circulation.

Was there a pre sale?

We raised a total of 135 BNB, where 1 BNB = 444.444. The max anyone could contribute was 5 BNB.
